Question 1

1 / 1 pts

Which point is in the feasible region for the constraints:

$x + y < 10$

$2x - 3y < 8$

$x, y > 0$

☐ (8, 6)

☐ (10, 0)

☒ (4, 4)

☐ (4, 10)

Question 2**1 / 1 pts**

Which point maximizes the objective function:

$$\max x + 5y$$

subject to the constraints

$$x + 2y \leq 10$$

$$4x + y \leq 12$$

$$x, y \geq 0$$

☒ (0,5)☐ (2,4)☐ (3,0)☐ (1,3)☐ (2,6)**Question 3****1 / 1 pts**

The Acme Company produces four types of widgets: A, B, C and D. The profit per widget and the resource usage of each type of widget is given in the table below:

| Widget Type | A | B | C | D |
|----------------|----|-----|---|-----|
| profit (\$) | 10 | 15 | 7 | 8 |
| Labor (hrs) | 2 | 1 | 3 | 1.5 |
| Material (lbs) | 3 | 2.5 | 6 | 5 |

| | | | | |
|--------------------|----|----|---|---|
| Water (gallons) | 10 | 12 | 8 | 9 |
|--------------------|----|----|---|---|

There are 100 hours of labor, 500 lbs of material and 1000 gallons of water available. If the goal is to maximize the total profit then the objective function is: (the variables A, B, C & D are the number of widgets of each type produced)

☐ $\min 10A + 12B + 8C + 9D$

☐ $\min 10A + 15B + 7C + 8D$

☒ $\max 10A + 15B + 7C + 8D$

☐ $\max A + B + C + D$

Question 4

1 / 1 pts

The Acme Company produces four types of widgets: A, B, C and D. The profit per widget and the resource usage of each type of widget is given in the table below:

| Widget Type | A | B | C | D |
|-----------------|----|-----|---|-----|
| profit (\$) | 10 | 15 | 7 | 8 |
| Labor (hrs) | 2 | 1 | 3 | 1.5 |
| Material (lbs) | 3 | 2.5 | 6 | 5 |
| Water (gallons) | 10 | 12 | 8 | 9 |

There are 100 hours of labor, 500 lbs of material and 1000 gallons of water available. The constraint associated with labor is:

☐ $2A + B + 3C + D = 100$

☐ $2A + B + 3C + 1.5D \leq 500$

☐ $A + B + C + D \leq 100$

☒ $2A + B + 3C + 1.5D \leq 100$

Question 5

1 / 1 pts

The solutions to a linear programming problem will always be integers?

☐ True

☒ False

Question 6

1 / 1 pts

Consider the following linear programming problem:

max $x + y + z$

subject to

$$2x + 3y + z > 100$$

$$x < 10$$

$$z, y \geq 0$$

select the following that best describes its solution(s).

☐ Infeasible

☐ One optimal solution

☐ Two optimal solutions

☒ Unbounded

Question 7

1 / 1 pts

Consider the single-pair shortest path problem in a weighted directed graph $G=(V, E)$ from a vertex s to t , where s denotes the source vertex and t represents the target/sink vertex. Let d_v denote the distance of any vertex v from the source vertex s . Moreover, let $w(u,v)$ represent the weight of the edge (u,v) . For each vertex $z \neq s$, consider the set Distances_z , where

$\text{Distances}_z = \{ d_{(u,z)} \mid \text{where } d_{(u,z)} = d_u + w(u,z) \text{ for each edge } (u,z) \text{ in } E \}$

To solve the single-pair shortest path problem using linear programming, we create the following linear program:

maximize d_t

subject to

$d_v - d_u \leq w(u,v)$ for each edge (u,v) in E

$d_s = 0$

Is it ok that we maximize d_t ? Why?

Select all that applies.

Yes, because minimizing it would result in an optimal solution where the distances of all vertices would be zero.

No. We should formulate it as a minimization linear program.

Yes, because an optimal solution requires the distance of the vertex z (i.e., d_z) to be the largest value that is less than or equal to the minimum of the values in Distances_z .

Yes, because both minimization and maximization would find the shortest path.

Question 8

1 / 1 pts

Consider the following linear programming problem:

max $x + y$

subject to

$$|x - y| \leq 20$$

$$x, y \geq 0$$

select the following that best describes its solution(s).

☐ One optimal solution

☐ Two optimal solutions

☒ Unbounded

☐ Infeasible
